**A platform that tokenize, track,
trade, and retire real carbon
credits transparently.**

Problem

- Carbon credits are **hard to track**.
- Double counting is **difficult to prevent**.
- Carbon markets are **hard to access**.

Statement

Solution ↙

Tokenize verified carbon credits.

Represent real, registry-backed carbon credits as assets on Solana.

Make every credit traceable and programmable.

Record provenance, ownership, transfers, and retirement status on-chain.

Let apps and businesses buy, transfer, fractionalize, or retire verified credits directly through Solana.

Business Model

Primary | Issuance fee

We are charging **1.5% of value minted**

Secondary | Trade fee

We are charging **0.4% per side**

Retirement certificates | Always free

Time is

Why Solana | 0.41s

Median finality, at a fee small enough to write every mint, transfer and burn on-chain — the record only works if nothing is batched off it.

Why Now | 2026

CSRD and Article 6 reporting begin to bite. Buyers now need an auditable retirement record, not a certificate emailed as a PDF.

Current Market | \$2.0 Billion / year

Voluntary carbon traded today, forecast to grow several times over as compliance schemes widen.
