AI food tracking apps need improvement to address accuracy, cultural diversity

29 August 2024

More accurate recognition needed for diverse dietary practices

A new University of Sydney study has found that improved artificial intelligence (AI) training is required when developing nutrition apps that are used to track food intake or manage weight.

AI food tracking apps need improvement to address accuracy, cultural diversity

29 August 2024

More accurate recognition needed for diverse practices

A new University of Sydney study has found that artificial intelligence (AI) training is required when using nutrition apps that are used to track food intake and body weight.

09/06/2024

In contrast, AI-integrated food apps often had difficulty accurately identifying energy content for mixed Asian dishes, for example the calories for beef pho were overestimated by 49 percent, while pearl milk tea had calorie underestimations of up to 76 percent.

"Nutrition apps with AI-integration are generally better at detecting individual Western foods when they are separated on a plate," said Dr Chen who is a senior research fellow at the University of Sydney. "However, they often struggle with mixed dishes, such as spaghetti and meat sauce, which are common with Asian dishes, which usually contain a variety of ingredients not in the respective apps database, leading to possible errors when tracking a meal."

Diabetics are managing in the dark.

THE EVIDENCE

“AI-integrated food apps often had difficulty accurately identifying energy content for mixed Asian dishes — calories for beef pho were overestimated by 49%, pearl milk tea underestimated by up to 76%.”

University of Sydney (Charles Perkins Centre) • 29 Aug 2024

WESTERN DATABASES

Mainstream AI food apps are trained on **Western meals** — Malaysian dishes get miscalculated significantly

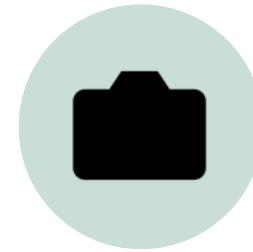

NOW WHAT..?

Apps hand back **raw numbers, not real advice** — users still don't know what to change

TRUSTED LOGS

Doctors only see A1c, a **3-month snapshot**. Not the **daily choices** that make a good reading, good, or a bad reading, bad.

**One photo.
Real data.
Real advice.**

IDENTIFY

AI reads the dish + ingredients

VERIFY

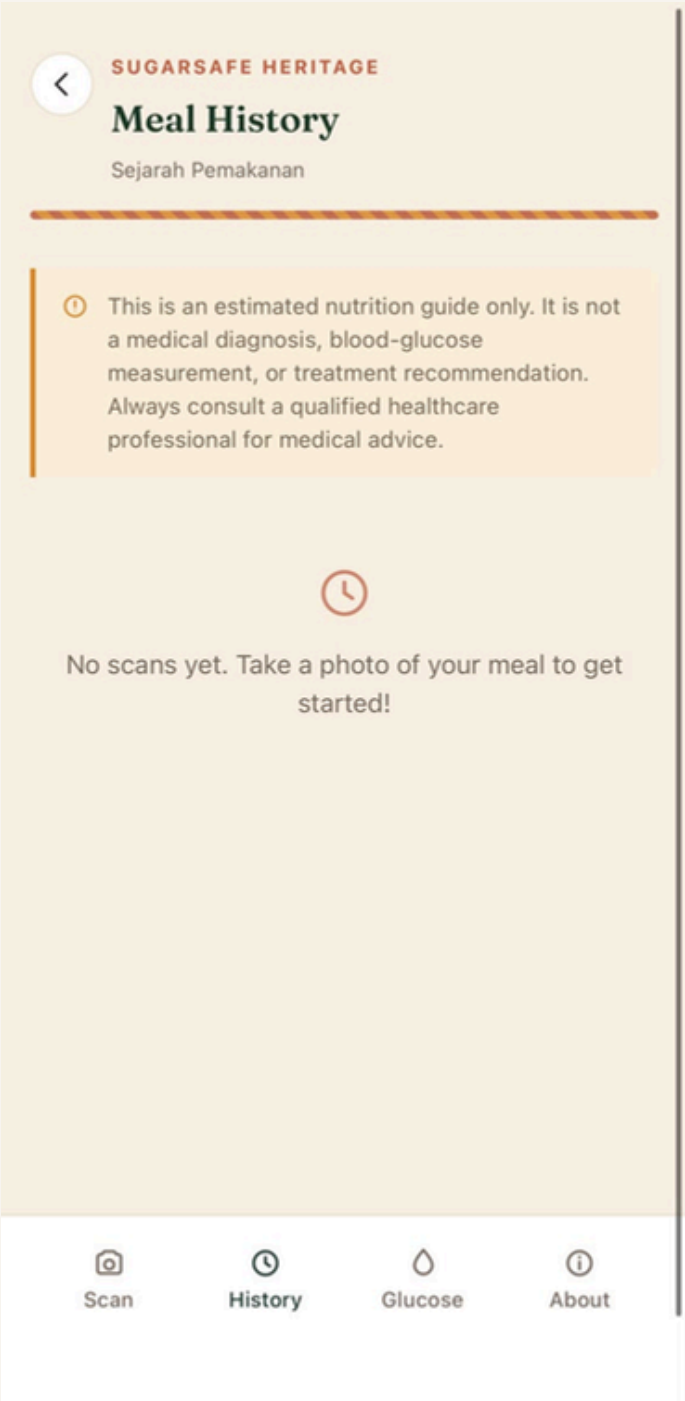

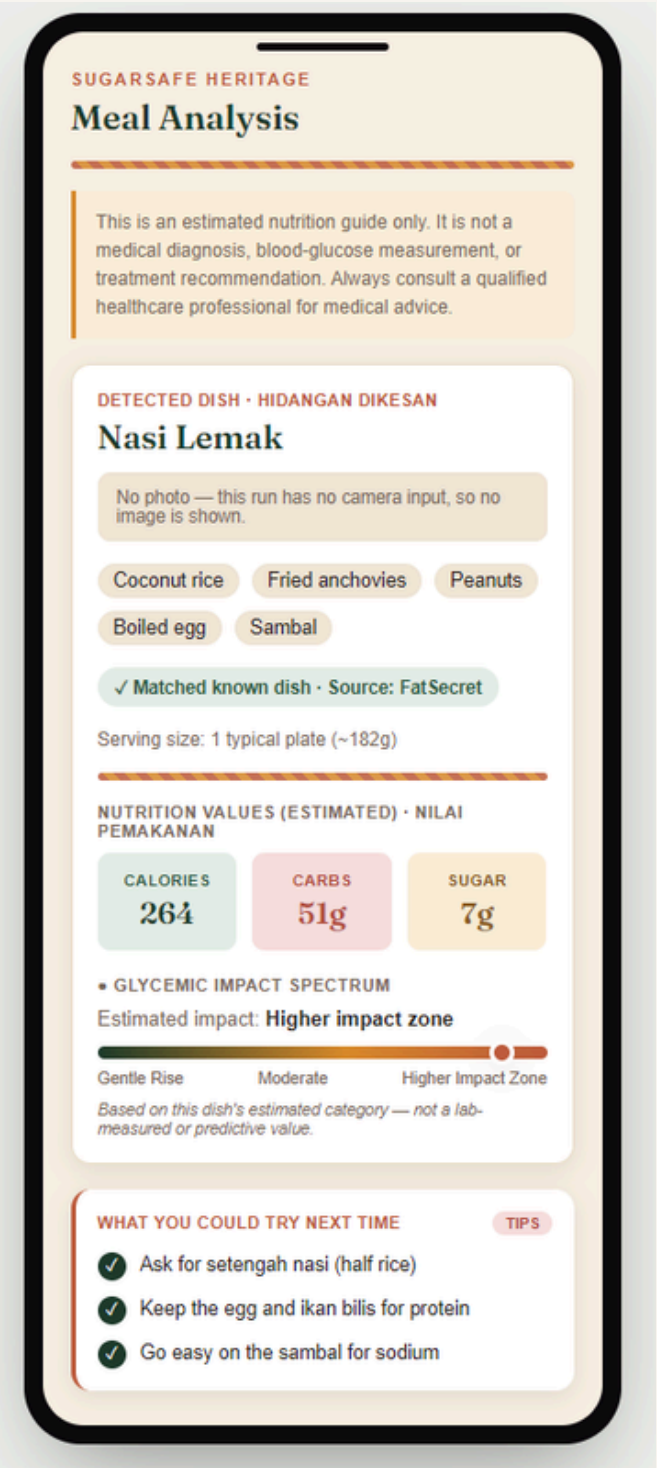

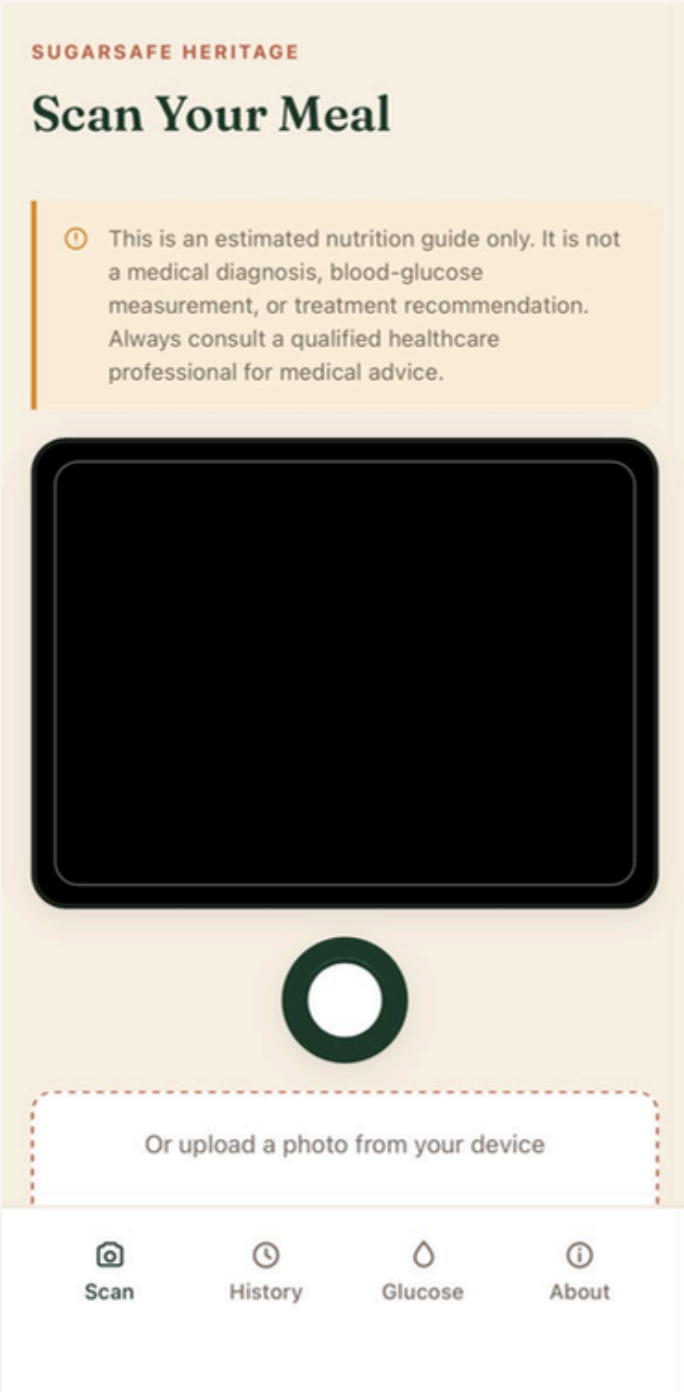

Nutrition from our Malaysian database, cross-checked vs. Ministry of Health data

ADVICE

One plain sentence + a real swap — not a lecture

This is deployed and working. Not a mockup.

SUGARSAFE HERITAGE

Confirm Dish & Ingredients

Sahkan Hidangan

prediabetes

Why Solana

- Every log is tamper-proof the moment it's written — by anyone, including us
- Fills the gap doctors (3-month A1c) and insurers (self-reported claims) can't verify
- Fast, low-fee transactions fit daily logging

Nobody's built for nasi lemak.

Everyone's fluent in pasta and salads.

Cal AI / MyFitnessPal

Huge databases, zero Malaysian dish accuracy

SNAQ / January AI

Real glucose-food correlation — built for a Western market

Kalo AI

Markets Asian food recognition — no diabetes focus

JurongHealth (SG)

Proved the model works — internal, not Malaysian, not public

The gap: diabetes-specific + accurate Malaysian food + practical advice.

Tested live. Real path to revenue.

Pre-launch stage

Real street-tested feedback

3-stage revenue roadmap

Traction

- Doubted AI-guessed nutrition → built database lookup
- Wanted blockchain → added Solana logging
- Shared meals hard to portion → added “how much did you eat” step

How we make money

- Freemium — free scanning, paid tier for full history
- Mid-term: clinic & diabetes-educator partnerships
- Long-term: usage-based insurance for verified management

**To our first
thousand users.**

01 **Month 1**

Verify database vs. MoH data. Onboard first 50 users from street-tested contacts.

02 **Month 2**

Partner with 1-2 diabetes educators/clinics. Ship content on real Malaysian meals.

03 **Month 3**

Freemium launch on app stores. Track retention & advice follow-through.

First-year CS student — learned Solana from zero, in days, under a hard deadline

Built this because my dad has diabetes — I watched him face "can I eat this?" every single day

Solo by choice, not by chance — I chose to start now rather than wait for the "right" team to appear

A repeated pattern, not a one-off: modular urban design for Tokyo (backed by a 95-space study), a banana-peel water filter that won 1st place, now SugarSafe

Why me, specifically.

What I need next.

- Mentorship — sharpening the clinic and insurer go-to-market path
- Introductions — to Malaysian diabetes educators or clinics
- Continued support to keep building past this week

***SugarSafe doesn't tell you to give up nasi lemak.
It shows you how to keep eating it.***
